

Final Review: Engineering Internship 2026

Digital **Automation** & Operational Excellence

Vedang Trivedi | Intern KHMS Digital Automation

Guided by: Vikas Choudhary, Manager KHMS/AIT

600 × 400

| Executive Overview

The Challenge

Solving systemic bottlenecks in GBS health-check reporting and establishing a governed low-code ecosystem. Moving from 24 disjointed Excel files to a single source of truth.

Key Deliverables

Developed GBS HC 2026 Power App and AIT Opportunity Tracker. Processed 1,800+ historical records and standardized workflows across 8 operational towers.

 **Maintained Zero-Miss SLA for 6 straight months**

| Identifying Bottlenecks

Data Fragmentation

- ✗ 24+ siloed Excel workbooks across towers
- ✗ Inconsistent layouts and naming conventions
- ✗ No real-time visibility for leadership
- ✗ Intensive manual cleaning of corrupted records

System Architecture

An end-to-end Power Platform solution built on a unified data core.

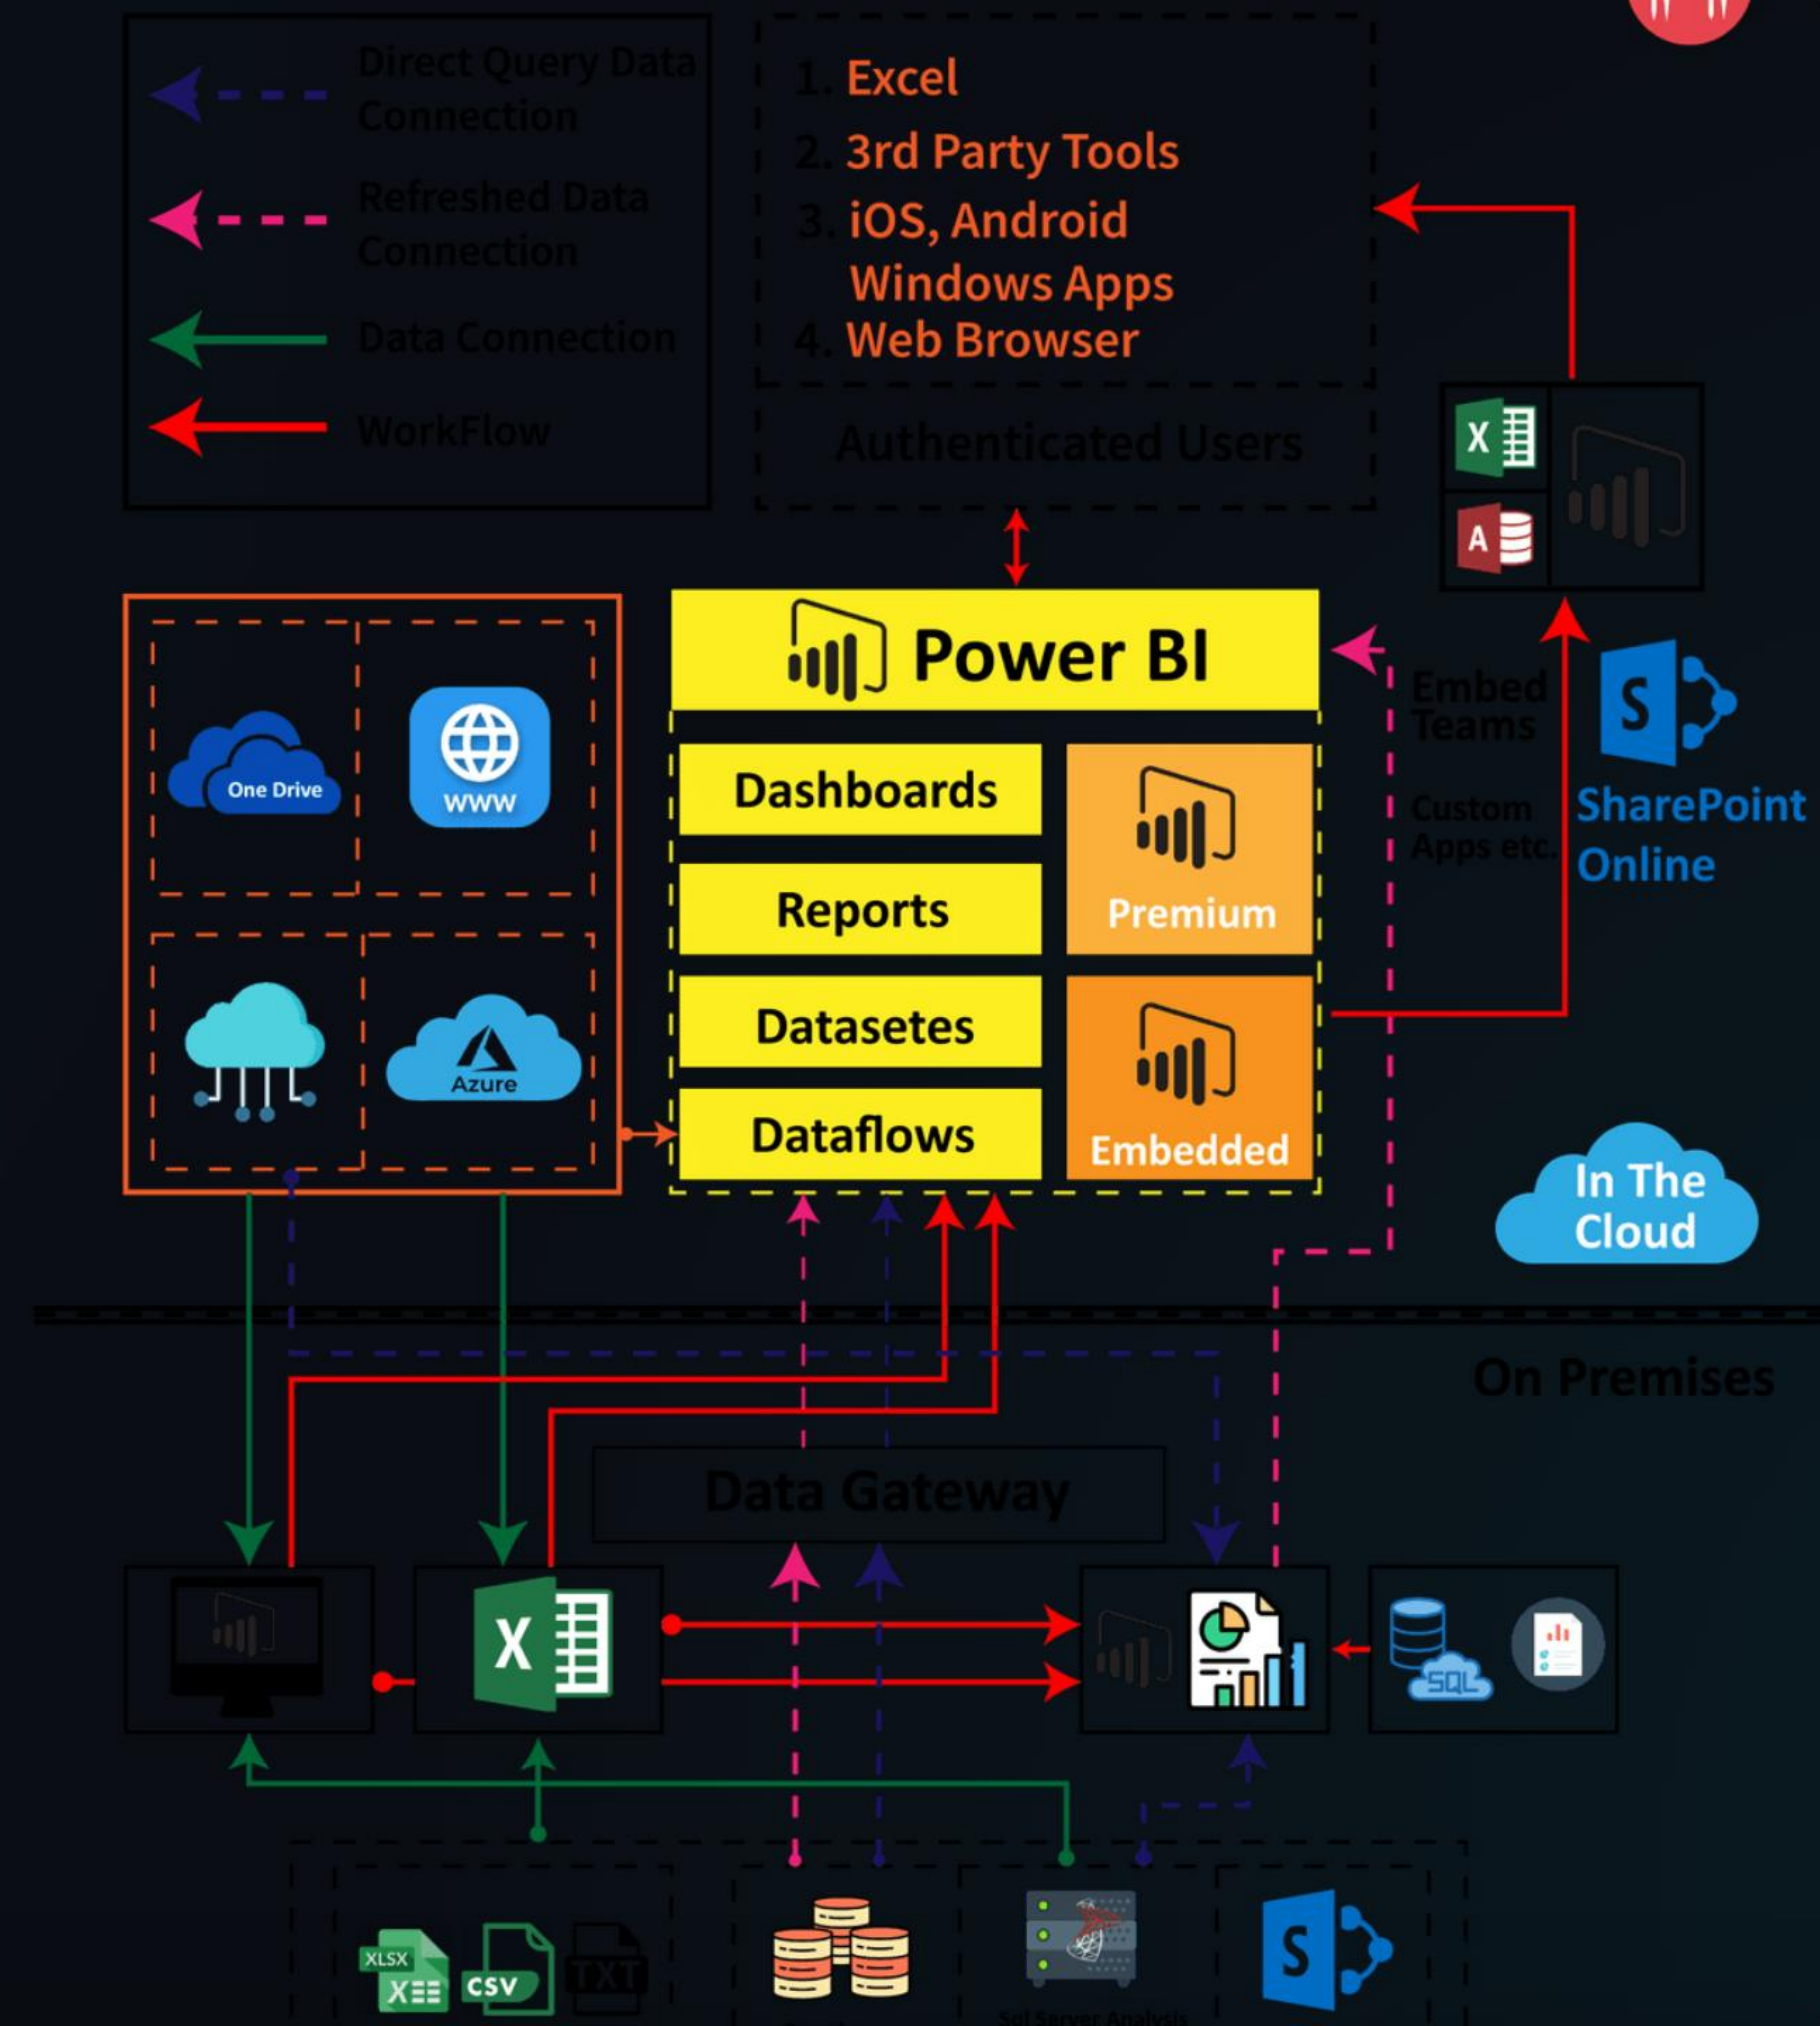

Frontend: Power Apps (Canvas) for structured intake.

Logic: Power Automate for daily alert loops.

Storage: SharePoint Lists (Enterprise Database).

Analytics: Power BI Real-time Dashboards.

Identity: Microsoft Entra ID (Native Mapping).

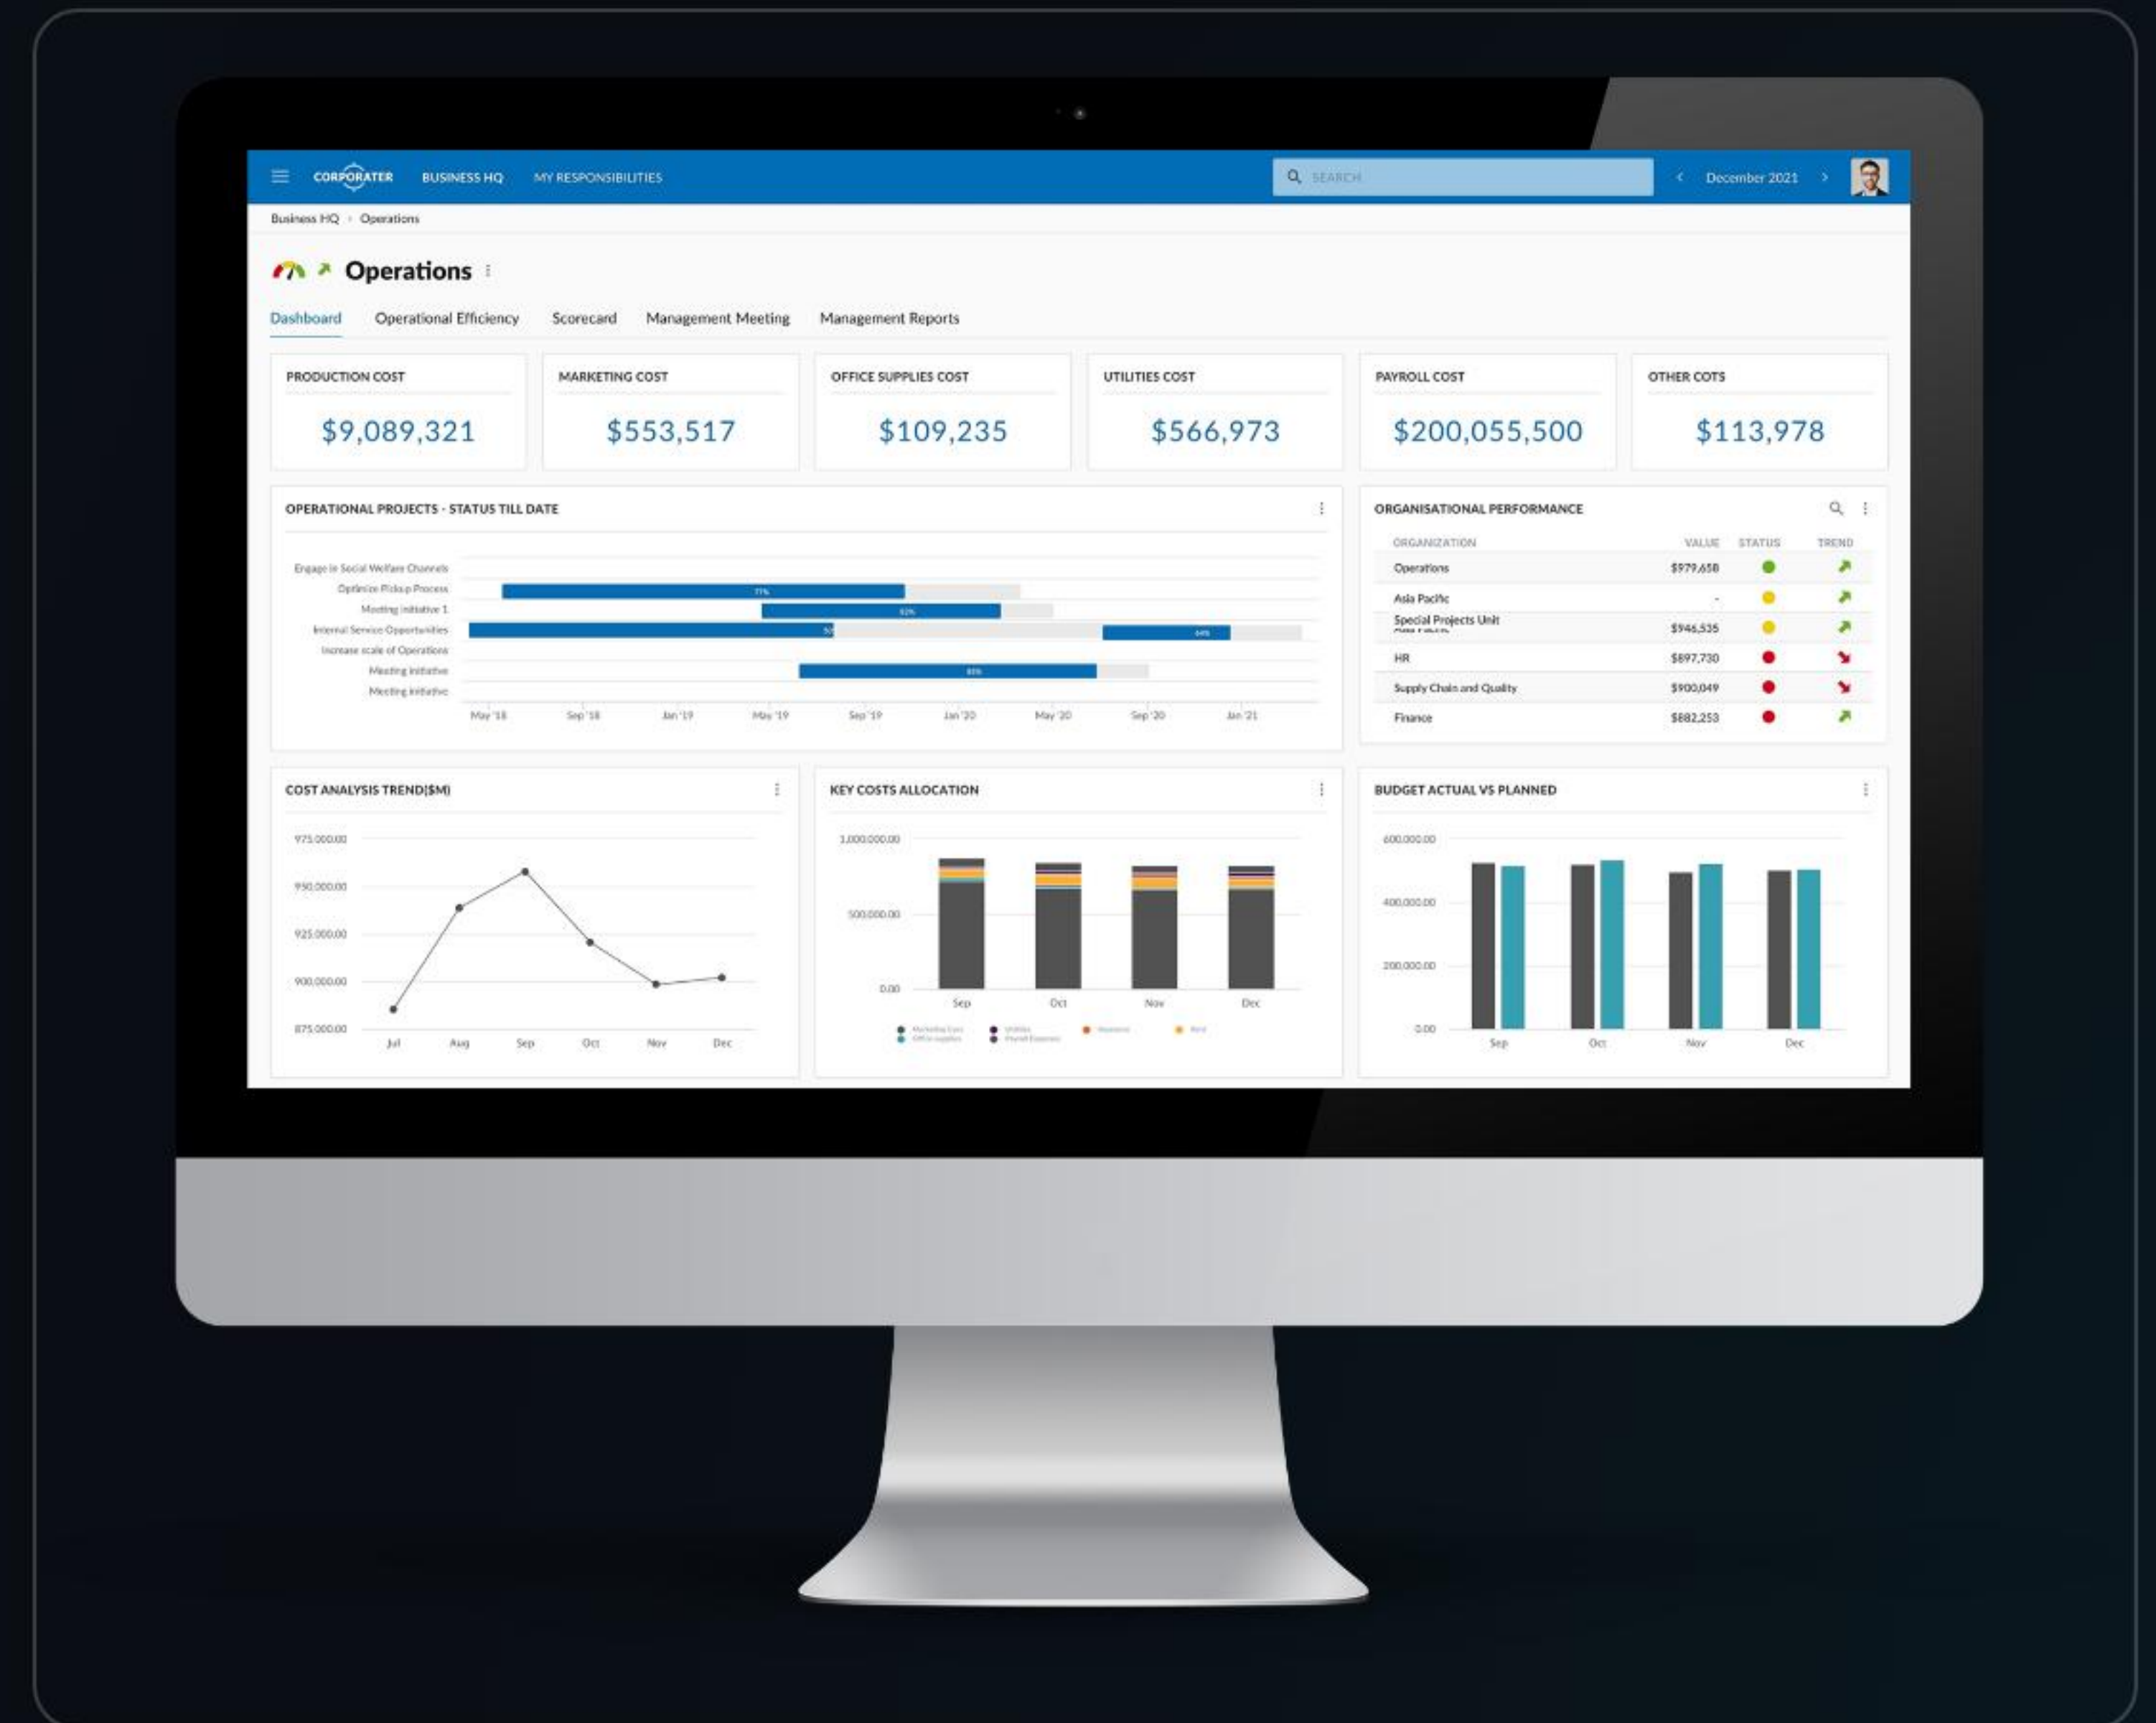

GBS HC 2026 Power App

Health Check Wizard

Designed a wizard-driven application to replace manual Excel entries for global tower metrics.

- **47 Validation Checks:** Conditional logic based on tower pillar.
- **Entra ID Identity:** Automatic user profile resolving (Zero manual entry).
- **Power Fx Logic:** In-memory data collections for state preservation.
- **Data Integrity:** Server-side filtering to bypass delegation issues.

| AIT Opportunity Tracker

Intake Phase

Teams propose efficiency ideas via mobile-responsive forms. Metadata captured: Priority, Business Unit, and Impact.

Execution Flow

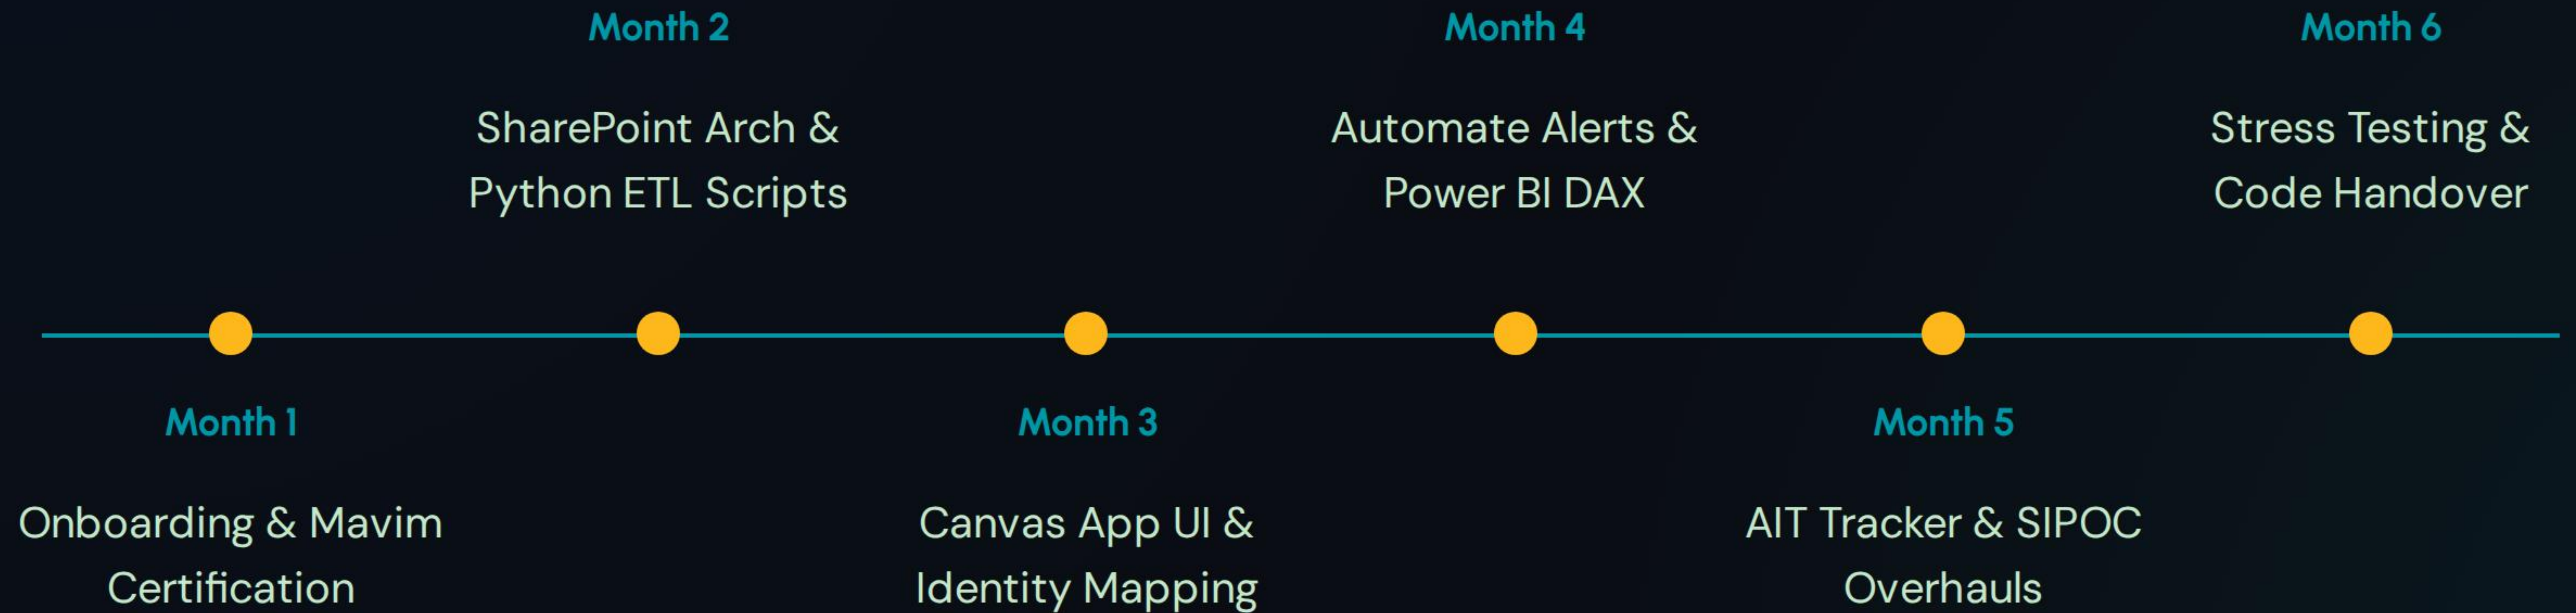

Operational managers assign tasks and track status from 'Submitted' to 'Closed' via Admin Dashboards.

Full Visibility

Background flows notify team leads instantly, creating a structured innovation pipeline across GBS towers.

| 6-Month Progress Roadmap

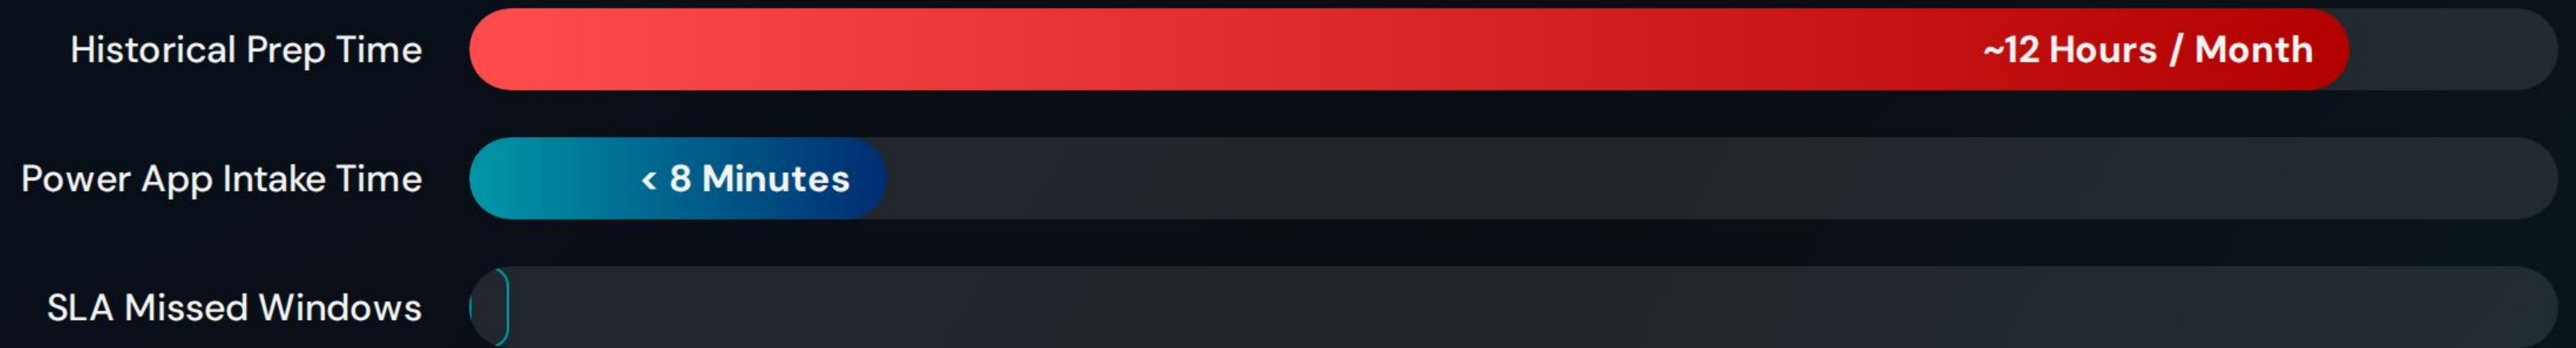

SIPOC & Escalation Matrix

Tower Segment	SIPOC Standardisation	Escalation Matrix	Status
Global Procurement (GPS)	Completed	Completed	✓ Ready
Data Management (DMO)	Completed	Completed	✓ Ready
Finance & Accounting	Completed	Completed	✓ Ready
Supply Chain (SCF)	Validated	Standardized	✓ Ready
Accounts Payable (AP/PTP)	Validated	Validated	✓ Ready

Covered 8 primary business towers with programmatic Excel generation using Python.

| Operational Efficiency Gains

The transition to a digital core eliminated manual tracking delays by roughly **65%** across all participating towers.

| The Data Engine

1,827

Historical Rows Migrated

Python ETL Pipeline

Recovered 6 months of legacy values from 24 fragmented spreadsheets using custom automation scripts.

- **Recursive Scanning:** Regex paths to classify regional zones.
- **Schema Normalization:** 12-column corporate mapping.
- **Graph API:** Token-authenticated post requests to SharePoint.
- **Data Integrity:** Purged test records & flagged outliers automatically.

| Key Takeaways

"Low-code is a specialized engineering discipline that requires client-state tracking, query optimization, and the same rigor as traditional frameworks."
